

Directories: Creating, Removing, and Changing Directories

Learn the ins and outs of managing directories in your computer system. From creating and removing directories to changing directories and scanning their contents.

Creating Directories

1

mkdir

Use the `mkdir` command to create new directories in your file system.

2

Organization

Create a folder hierarchy that suits your needs for better file management.

3

Customization

Choose meaningful names for your directories to easily identify their purpose.

Removing Directories

1 rmdir

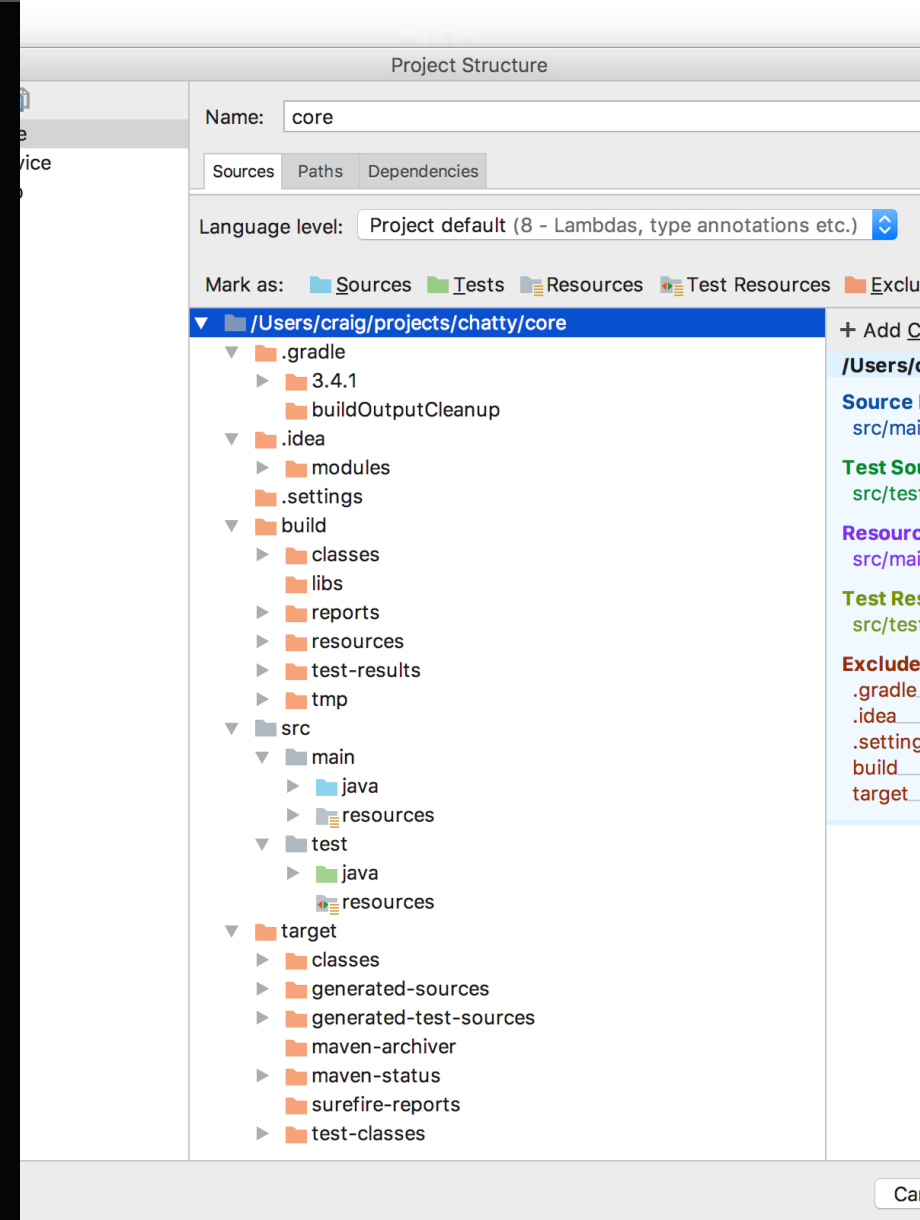

Delete directories using the `rmdir` command and clean up your file system.

2 Confirmation

Be cautious! Confirm that the directory you want to remove is empty to avoid accidental data loss.

3 Recursion

Use the appropriate options to remove directories and their contents recursively.

Changing Directories

1 chdir

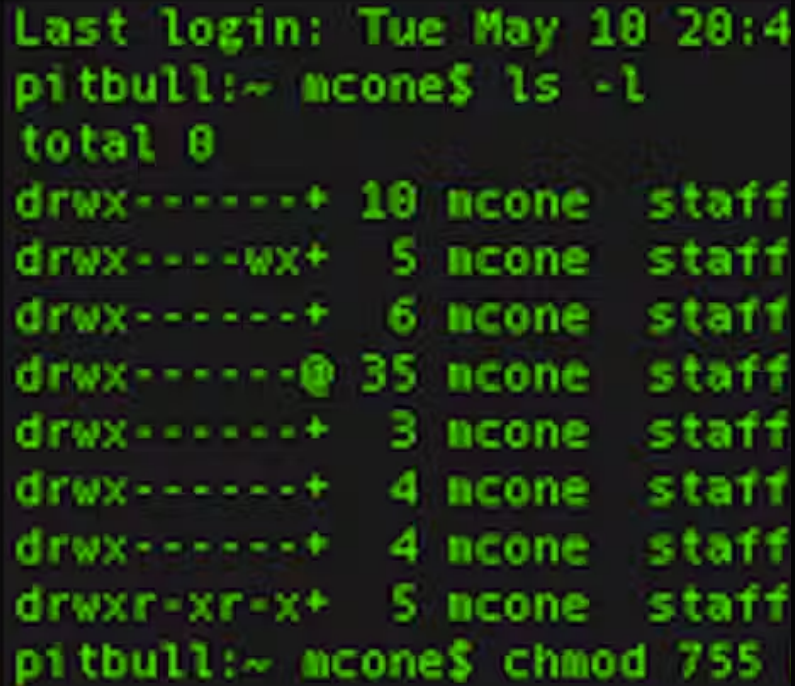

Switch between directories using the `chdir` command for easy navigation.

2 Relative and Absolute Paths

Use relative paths (e.g. `../`) or absolute paths (e.g. `/path/to/directory`) to specify the target directory.

3 Working Directory

Keep track of your current working directory to ensure you are executing commands in the correct location.

A terminal window titled 'mcone' with a home icon. It shows the output of the 'ls -l' command and the start of a 'chmod' command. The window has standard macOS window controls (red, yellow, green buttons) in the top left corner.

```
Last login: Tue May 10 20:4
pitbull:~ mcone$ ls -l
total 0
drwx-----+ 10 mcone  staff
drwx---wx+   5 mcone  staff
drwx-----+  6 mcone  staff
drwx-----@ 35 mcone  staff
drwx-----+  3 mcone  staff
drwx-----+  4 mcone  staff
drwx-----+  4 mcone  staff
drwxr-xr-x+  5 mcone  staff
pitbull:~ mcone$ chmod 755
```

Obtaining the Current Working Directory

1 `getcwd`

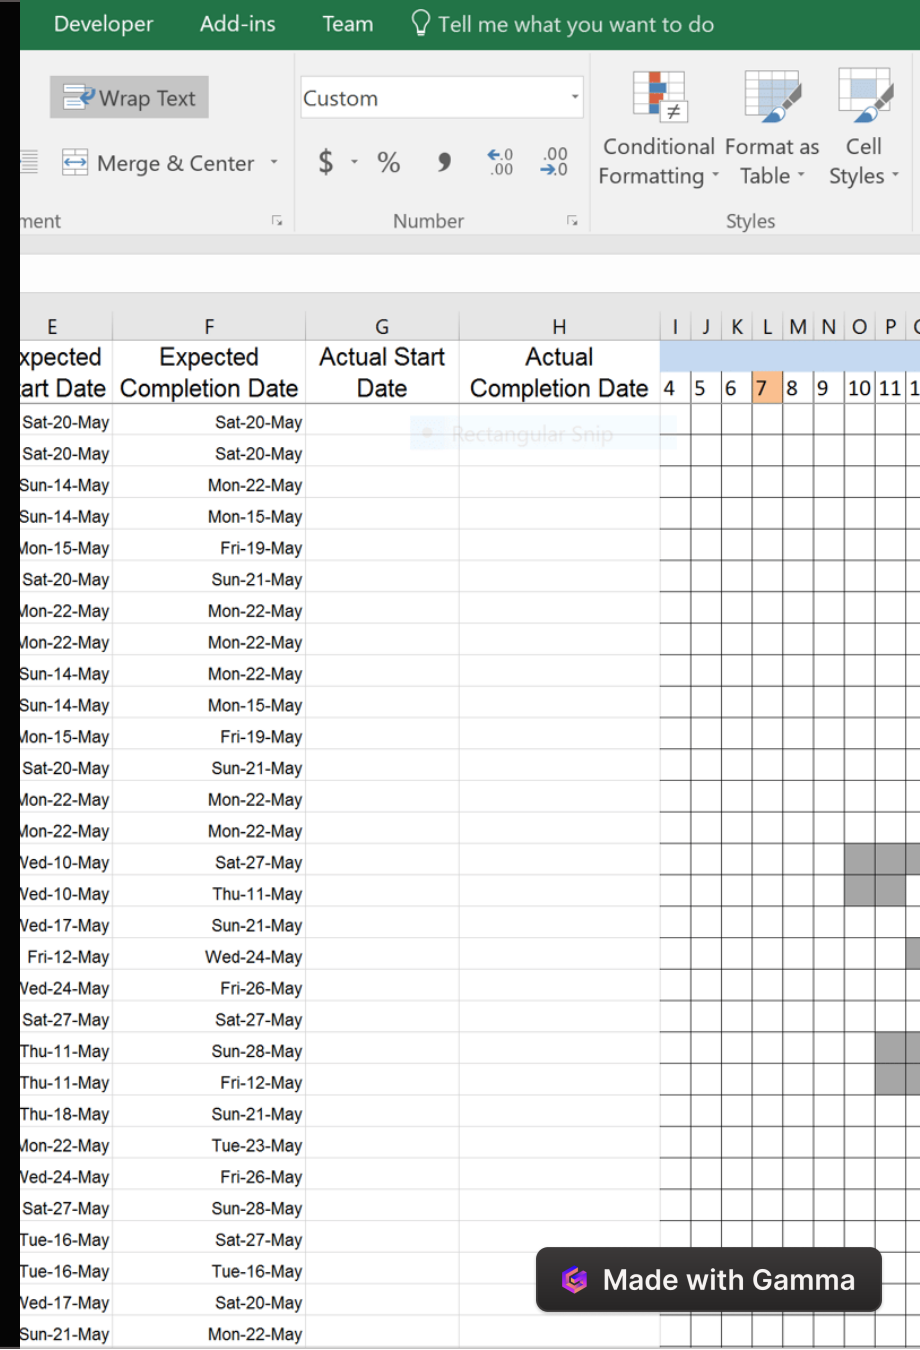

Retrieve the absolute path of the current working directory with the `getcwd` function.

3 Error Handling

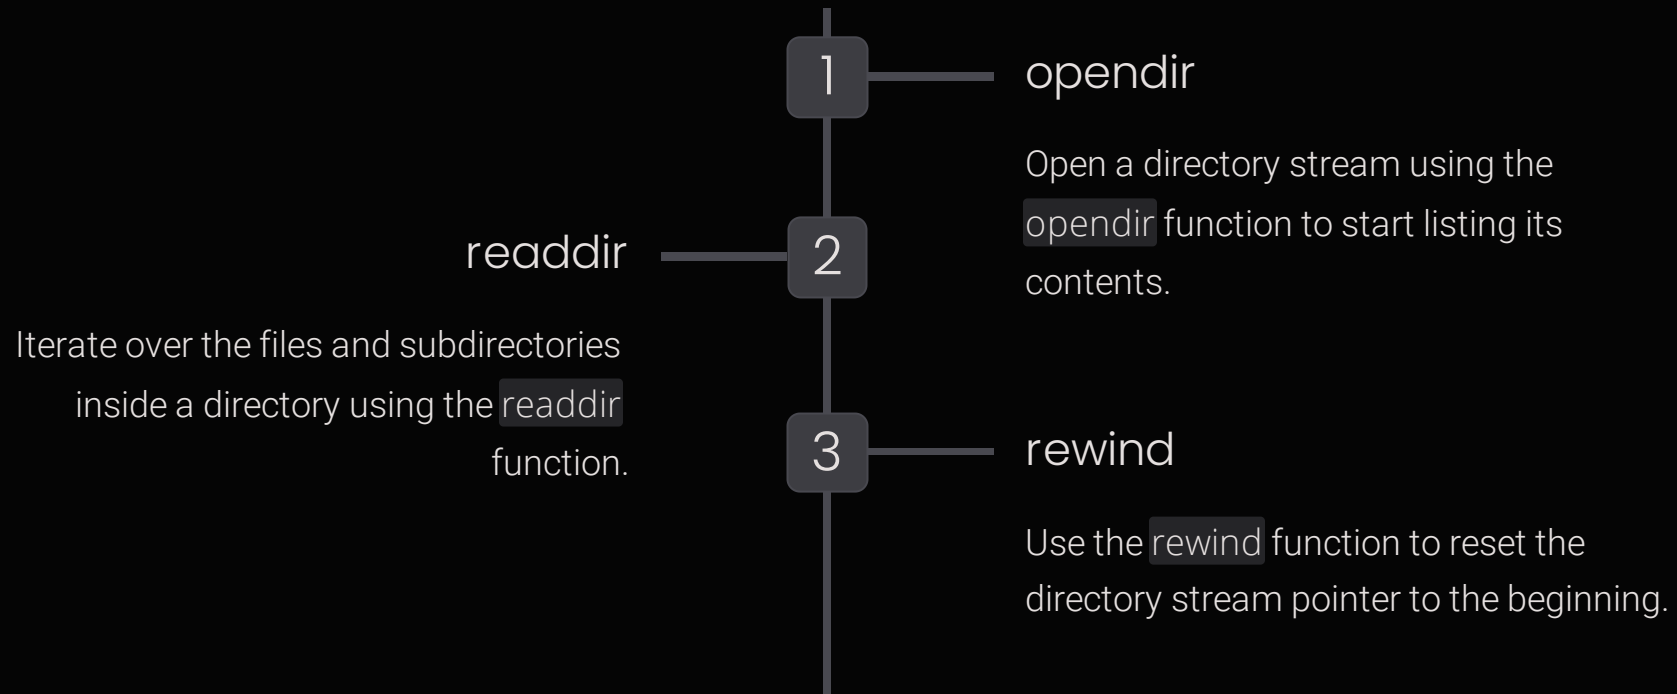

Handle any potential errors related to retrieving the current working directory.

2 Print and Use

Display the current directory path or assign it to a variable for further processing.

Listing Directory Contents

Scanning Directories

Advanced Functions

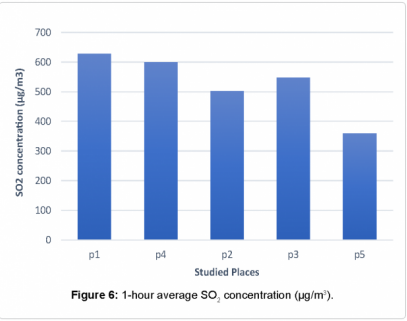

Discover additional functions for file system operations like `scandir` and `scandirat`.

Filtering and Sorting

Apply filters and sorting criteria to efficiently scan directories and manage large sets of files.

Performance Considerations

Optimize your directory scanning code to improve performance and minimize resource usage.

According to the EPA, standard levels in houses without using gas stoves are 0.5-5 ppm, and with gas stoves are 5-15 ppm (EPA 2009). Lee [32] found that cooking methods in restaurants had various emissions of particles and CO. The highest levels of pollutants are generated during barbecuing. Zhao [11] state that the cooking method can have a significant impact on emissions from Chinese cooking. Oil-based cooking produces air pollutants at much higher levels than water-based cooking. CO in P₅ mainly generated by fireplace and then because of air exchange spread out in kitchen.

Concentration of SO₂: The average concentrations of SO₂ in kitchens are presented in Figure 6 Like the other kinds of pollutants; generated SO₂ heavily depends of the type of cooking appliances and fuels [34]. Obviously, the concentration of SO₂ in P₁ and P₄ kitchens were relatively higher than others. The lowest concentration of SO₂ was recorded at P₅. Generally, four locations had SO₂ concentration near the national standard of AIQ (0.50 mg/m³, 1 h-avarage), and one location had a lower SO₂ concentration. In similar investigation, Cichowicz studied the concentration of NO₂, NO_x, O₃, SO₂, CO, PM₁₀, PM_{2.5}, and C₆H₆ in selected city, town and rural sites. [35].

Conclusion

This work was conducted under ordinary living conditions and without any control over the occupant’s normal daily activities.

Smoking did not take place by any occupants and all sampling was performed during winter. Selected pollutants were measured using continuous monitoring and allowed us to calculate the concentration of SO₂, NO, NO₂, and CO. Our results support the expectation that the concentration of indoor air pollutants grows dramatically during cold seasons because of the extra requirements for heating. They found out that the highest concentration of these pollutant occurred in winter. Importantly, in traditional kitchens (enclosed and semi-open), pollutants had a higher concentration. Therefore, residents particularly housewives, could be more affected by indoor pollution in such kitchens. Stove and fuel type, ventilation, method of cooking, heating system, and human activities, are other factors which play a crucial role in the concentration of indoor pollutants within enclosed spaces. To minimize the negative effects of indoor pollution and control them, it is suggested that efforts should be made to provide incentives and opportunities for using clean energies like electric instead of fossil fuels.

Acknowledgement

I am using this opportunity to express my gratitude to everyone who supported us throughout the course of this study. We are thankful for their aspiring guidance, invaluable constructive criticism and friendly advice during the project work. We are sincerely grateful to them for sharing their truthful and illuminating views on several issues related to the study. I express my warm thanks to Dr. Seena Rejal and Dr. Mohammad Ali Rejal for their financial support and scientific guidance.
